Actions on Share

This is where we earn our money, but need to be creative:

- Initially, just sending a vCard to the contact is fine
- However, need to brain storm how to make platform independent, w/o need of app
- I'm thinking, we over ride this Txt/ Email send functions, to send the contact and connection to our server, and our server sends an encoded link to a website that will download their vCard
 - Put also prompt them to:
 - Enter their own info
 - Download the app
- + Server needs to record connection details in database
- + Adam from Permit Zone thinks this can be accomplished via a WebApp

** Things that need to happen on Share:

1. Text them our vCard to receivers phone
2. Save info about connection onto senders profile for later access
3. Send a text to receiver, allowing them to send back their vCard this may be complicated as it may need to be a link to a website that will “suck/ pull” their vCard off their phone.
4. Send link allowing them to download the app if they don't have it already.
